### Abstract

*This study explores the dimensions of Filipino college students' condom use self-efficacy beliefs using the Condom Use Self-Efficacy Scale (Bradford and Beck, 1991). There were Five-hundred eighty (N=580) college students participated in this study. The Exploratory and confirmatory factor analysis was conducted to explore and test the derived factor structures. The exploratory results revealed four dimensions: Partner's Pleasure, Sexual Prejudices, Appropriation, and Assertiveness. This structure was later collapsed into better 3-factor model fitting. The results also indicate how Filipino college students' condom use self-efficacy beliefs have shown similarities and differences with the models found in literature.*

**Keywords:** *self-efficacy, condom use*
